The crude and remaining emulsion flow from the heater section into the distributor, which provides enhanced dispersal and separation above the oil/water interface. The treated oil flows into the settling section and is then directed to the oil outlet for delivery to storage or pipeline.

Mechanical Heater Treater SPEC Oil Gas Technologies

SPEC has a large array of modular horizontal heater treater packages capable of treating in excess of 20,000 BLPD and low API crude. The heater treater consists of two main sections: the heating section and the coalescing section.

Horizontal heater treater OilfieldWiki

Horizontal heater treaters are used in the oil/gas industry to help facilitate oil/water separation by speeding up emulsions separation through applying heat. Heater treaters can be thought of as low pressure, three phase separators equipped with fire tubes. They separate gas from the incoming emulsion and separate the emulsion into a water phase and an oil phase. Heater treaters can also function as a freewater knockout, a heat exchanger, a filter, and as a water wash tank.

A heater treater is a pressure vessel that uses heat and residence time to separate clean, dry oil from incoming fluids. It usually is located immediately downstream of the Free Water Knockout during the oil dehydration process. The heat allows for easier separation of the oil and water and also allows solid particles such as sand and corrosive products to settle out. The quality of the effluent oil is measured with a bulk sediment and water (BS&W) probe.

NATCO DUAL POLARITY Electrostatic Treater Schlumberger

The NATCO DUAL POLARITY electrostatic treater outperforms both mechanical and AC electrostatic treaters in crude oil dehydration and desalting applications in upstream and downstream operations. The treater can be delivered as a heater treater, providing heating and dehydration in a single vessel

Separators Heater treaters and Pressure in Oil Gas

Controlling the height of the water column in the heater-treater is an important aspect of using the heater treater. The level of water should be about one foot above the fire tube. In other words, water fills the space from the bottom of the tank to one foot above the fire tube, with oil above that. As oil flows from the inlet tube and up, it will flow past and around the fire tube.

saving fuel and oil gravity. A heater-treater (Fig. 4) is normally used in "treating" oil emulsions. The heater-treater uses thermal, gravity, mechanical, and sometimes chemical and/or electrical methods to break emulsions. Free Water Knockouts (FWKOs) When there is sufficient free water production on a lease, a FWKO (Fig. 6) is often installed to separate free gas and free water from free

Emulsion treating methods petrowiki org

Flash systems use the excess heat in the oil that is received from the treater or treating system and convert it to latent heat at or near atmospheric pressure. A surface condenser condenses the flashed steam in the cooler, incoming stream of raw crude, thus scavenging the excess heat that ordinarily would be wasted.
